

## ASHI sponsors the 2019 STAR meeting

One of the key conclusions from the first STAR meeting held in 2017 was that a major gap in risk stratification for organ transplantation is (lack of) knowledge, and more importantly, tools to detect potential of immune-memory responses prior to transplantation. Additionally, risk stratification and the immunobiology that leads to generation of *de novo* donor specific antibody production is poorly understood.

ASHI is proud to announce that it is supporting the 2019 STAR session which will be held just prior to the AST CEoT meeting in Feb 2019. The half day STAR 2019 meeting is designed to present current knowledge and have open discussions that will lead to the second STAR publication, with further recommendations for risk stratification.

The STAR 2019 Meeting will take place on Thursday, February 21<sup>st</sup>. To register for CEoT 2019 and the STAR 2019 Pre-Meeting, please click [here](#).
